Jul 31, 2020 The PEc planning system is an electrical engineering software that works directly with the electrical engineering disciplines: electrical, Mechanical, Structural, Electromagnetic and thermal/hydraulics in the process of engineering design and analysis of electrical equipment. PEc is a modular software which provides a framework that allows to quickly and efficiently develop electrical engineering solutions. PEc is also well suited as a part of a team working in the PEc framework. As such, PEc is the choice of numerous companies and research organizations due to its robust design and componentized architecture. PEc offers all the functionalities of an electrical engineering software, while providing a framework that allows to tailor to a specific design need. PEc aims to provide the means for a fast development environment that supports engineering projects through the implementation of a rapid and efficient. PEc offers many professional and simple tools such as the powerful 3D geometry module for electrical engineering, voltage and current calculation and module for electromagnetic simulation. PEc can be used for engineering, marketing and product design. PEc allows for the definition of electrical components and the provision of electrical layout/handoff, which can be displayed on the PEc MEP surfaces. PEc supports the analytical representation of electrical components in the form of 3D geometry, which can be used for electromagnetism calculation. PEc is a complete solution for electrical engineering. The PEc is used for engineers from undergrad to PhD level and starts with core electrical design that is supported by a full-f f678ea9f9e
